

GENEDRIFT

EDITORIAL PUBLISHING PLATFORM

Client Walkthrough

From idea to governed publication

A concise guide to the Creator workspace, dashboards, review models, publishing controls and public delivery.

One governed path from editorial work to public delivery

Creator controls the work. Catalyst controls publication integrity. The website serves the approved result.

Platform orientation — editorial control, trusted publication and public delivery.

DESIGNED FOR CLARITY Each person sees the work relevant to their role, while every important decision remains traceable in the audit history.

Prepared for Genedrift stakeholders · Version 1.0 · September 2026

01 / PLATFORM WALKTHROUGH

The platform in one view

Genedrift combines a role-aware editorial workspace with a controlled publishing engine and a modern public Insights experience.

One governed path from editorial work to public delivery

Creator controls the work. Catalyst controls publication integrity. The website serves the approved result.

The end-to-end platform map.

How the pieces work together

- Zoho Creator manages content, roles, reviews, status and audit history.
- The Article Workspace supports day-to-day writing, reviewing and publishing.
- Zoho Catalyst validates the approved revision, stores immutable files and returns a signed result.
- The public website displays only content that completed the governed path.

CORE PRINCIPLE Approval confirms that content is ready. Publication is a separate Publisher decision.

Who does what

Access is role-based. Combined roles are possible, but each action is still checked against its own permission.

Role	Primary responsibilities	Key guardrail
Editorial Author	Create drafts, write, add media and metadata, submit, respond to requested changes.	Cannot review their own work or publish.
Reviewer	Claim assigned or queued reviews, comment, approve, request changes or reject.	Cannot edit the author's draft or publish unless separately assigned Publisher.
Publisher	See approved/scheduled work, publish now, schedule, reconcile and retract.	Cannot alter the approved revision or record review decisions without Reviewer access.
Editorial Admin	Supervise workload, roles, taxonomy, policies, audit, reviews and publishing operations.	Immutable submitted, approved and published revisions remain protected.

What role-aware means

The same dashboard adapts to the signed-in person. Authors see their work, reviewers see eligible review tasks, publishers see content ready for delivery, and admins can supervise the whole system.

IMPORTANT The CEO/owner account is not intended as the everyday editorial admin profile. Normal client operations should use the dedicated roles above.

Creator structure and forms

The workspace is the everyday interface; its forms are the auditable system of record.

Area	Core forms	Purpose
Content	Articles	Master record: owner, category, policy, workflow state and active revision pointers.
Content	Article Revisions	Versioned content and SEO details; submitted, approved and published versions are protected.
Content	Media Assets	Cover and inline images with file details, alt text, caption, credit and processing status.
Discovery	Categories and Tags	Reusable taxonomy used in the editor, dashboard filters and public Insights archive.
People	Employees and Role Assignments	Maps users to active Author, Reviewer, Publisher and Admin capabilities.
Review	Approval Policies	Defines review model and number of distinct approvals required.
Review	Review Assignments and Comments	Reviewer slots, claims, decisions, summaries and discussion history.
Publishing	Publication Jobs and Published Versions	Tracks publish, schedule and retract actions plus the immutable Catalyst version.
Governance	Audit Events, Redirects and Site Settings	Preserves transitions and controls public behavior.

CLIENT USE Use forms for configuration and supervision; use the Article Workspace for lifecycle actions.

Dashboard orientation

Start here to understand what needs attention, then narrow the workspace using scope, work type and filters.

Dashboard orientation — scope first, then work type, filters and task panels.

The three scopes

- Mine — your authored articles and review assignments personally assigned to or claimed by you.
- Queue — unclaimed shared reviews and publisher-ready work that your current role can act on.
- All — cross-team visibility for Editorial Admin/owner supervision; unavailable to users without that authority.

Find the right work quickly

Choose All work, Articles, Reviews or Publishing, then refine the result by state, category and sort order. Search can find titles, people, categories and review decisions. Clear filters returns to the default view without changing any content.

Create and prepare an article

The writing workspace keeps editorial content, media, metadata and workflow context together.

Start a draft

1. Select New article from the dashboard.
2. Enter a working title, category and approval policy, then choose Create and open. Use Open full form only for administrative setup.

Complete the writing workspace

Workspace area	What to complete
Writing surface	Body copy, H2–H4 headings, links, lists, quotes, tables and inline images.
Article settings	Excerpt, category and tags.
Cover image	JPG/PNG/WebP/GIF up to 10 MB, with required accessible alt text; caption and credit are optional.
Search settings	SEO title, SEO description and robots directive.
Revision summary	Current revision state, word count and estimated reading time.

BEFORE SUBMISSION Preview the article, confirm the cover and metadata, then submit the saved draft. The submitted revision becomes read-only so the reviewed content cannot silently change.

Choose the right review model

Both models use independent reviewers and the same controlled publishing path.

Two review models, one controlled publishing path

At any review stage, Request Changes creates a new draft revision while preserving the submitted revision and its feedback.

Standard and Regulated Review paths.

Reviewer assignment

The author can name eligible reviewers or use the shared queue; unfilled approval slots are queued automatically.

- Self-review is blocked, and one reviewer cannot satisfy both Regulated Review slots.
- Every claim, comment and decision is connected to the exact reviewed revision.

How a Standard Review article travels

Use this path for normal editorial content that requires one independent approval.

1. Author drafts the article, completes media and metadata, and selects Standard Review.
2. Author submits to a named reviewer or the shared queue. The article becomes In Review and the submitted revision is locked.
3. Reviewer opens the Review Inbox, claims the assignment when required, reads the exact revision and adds discussion comments if needed.
4. Reviewer chooses Approve, Request Changes or Reject. Request Changes and Reject require a clear decision summary.
5. One approval moves the article to Approved. A Publisher can then publish immediately or schedule it.

If changes are requested

The system preserves the submitted revision and creates Revision N+1 as a new Draft. The author sees the reviewer's comments, updates the new draft and resubmits it through the same controlled path.

RESULT The public site never receives a draft or an in-review revision—only the exact approved revision handed to publishing.

How a Regulated Review article travels

Use this path when the content requires two independent approvals before it can reach publishing.

1. Author selects Regulated Review and submits the completed draft.
2. The system creates two reviewer slots using named reviewers, queue slots or a combination of both.
3. Reviewer A claims and approves the first slot. The article deliberately remains In Review.
4. Reviewer A cannot claim or approve the second slot for the same revision.
5. Reviewer B reviews independently and approves the second slot. The article becomes Approved exactly once.
6. Publisher completes immediate or scheduled publication using the same publishing boundary as Standard Review.

Decision outcomes

Decision	System behavior
Approve	Records that reviewer's independent decision; the article advances only when the policy threshold is met.
Request Changes	Returns the article to the author, closes remaining open assignments and creates Draft Revision N+1.
Reject	Stops the current review path with a required reason; admin policy determines any future reopening.

Publishing and public delivery

One approved revision becomes a durable public version through a secure, verified handoff.

Immediate and scheduled publication converge on the same verified handoff.

Publisher controls

- Publish or Schedule — release the exact approved revision now or at a future time.
- Reconcile — confirm a completed job if the final Creator callback has not settled.
- Retract — stop public serving with a reason while preserving publication history.

SAFETY Retries and reconciliation reuse the same job, preventing duplicate public versions.

Using the dashboard by role

A practical starting view for each type of user.

User	Recommended starting view	Typical next action
Author	Mine → Articles	Open a Draft, continue Changes Requested work or create a new article.
Reviewer	Mine → Reviews, then Queue → Reviews	Handle assigned work first; claim eligible shared-queue work when capacity allows.
Publisher	Queue → Publishing	Publish or schedule Approved items; monitor Processing, Scheduled and Needs retry states.
Editorial Admin	All → All work	Review bottlenecks, queue depth, changes requested, approved work and recent activity.

What the main panels mean

- Review Inbox — active assignments that are assigned, queued or claimed.
- Article Work — drafts, changes requested and content currently in review.
- Publishing Queue — approved, scheduled, processing or retryable publication work.
- Published / Retracted — current public outcome with immutable history retained.
- Review History and Activity — closed decisions and the chronological audit trail.

Automatic email notifications

The platform sends best-effort, role-aware email updates after the related workflow action is safely recorded: reviewers are alerted when work is submitted; the author/owner is alerted when a review is claimed or decided; publishers are alerted when an article becomes ready; and the author/owner receives scheduling, publication, retraction or failure updates.

REMEMBER Email is a convenience alert. The dashboard, workflow state and Activity history remain the source of truth if an email is delayed or filtered.

LIVE DATA The dashboard refreshes normally and checks more frequently while active publication jobs are running.

Status guide and good operating habits

Use the state first: it tells you who owns the next step and which actions are safe.

Status	Meaning / next owner
Draft	Editable working revision — Author.
In Review	Submitted revision is locked; waiting for reviewer decisions — Reviewer(s).
Changes Requested	A new draft revision is available with feedback — Author.
Approved	Review threshold is complete; waiting for publication — Publisher.
Scheduled / Processing	Planned or active Catalyst delivery — Publisher monitors status and uses Reconcile only when prompted.
Published	Visible on the public Insights site — Publisher/Admin monitors.
Unpublished / Retracted	Removed from public serving; immutable history remains — Publisher/Admin.

Recommended habits

- Use the Article Workspace for lifecycle actions; avoid editing workflow records directly.
- Before submission, confirm the policy, reviewers, alt text and SEO metadata.
- Read the decision summary before responding; reconcile only when prompted and retract rather than delete.

WHEN UNSURE Confirm the article's state and revision, then read Workflow facts and Activity for the next step.
